MODEL **244 RX**

NEW AIR INLET

The air inlet is moved from the clutch side to the flywheel side in order to get a cleaner intake air and with that also improved air filter function. The intake air is taken via an air inlet in the starter housing on the flywheel side of the crankcase.

At the same time, the earlier air inlets in the clutch side of the crankcase are removed.

Crankcase compl. Ref. No. 502 05 44-03 and the starter housing Ref. No. 502 05 40-01 remain unchanged.

The change is introduced from serial number 7410500,

NOTE!

When mounting a new starter housing with this new air inlet on older saws manufactured before serial number 5090960, the clamp ref. no. 502 05 62-01 must be cut 8 mm (5/16"), according to the illustration.
