Model 250PS

Sealing ring and pressure relief valve on the hydraulic motor

To meet the application requirements for the valve unit on skylifts, etc. the hydraulic motor on all pruning saws shafts will be fitted with a special hydraulic seal. At the same time the pressure relief valve will be replaced by one with a greater opening pressure. This modification is made in case of higher pressure on the return side, which can occur when the pruning saw shaft is used together with an external power source and valve unit. The modified pressure relief valve opens at 40 bar compared to the old which opened at 20 bar. The hydraulic motors fitted with a hydraulic seal and modified pressure relief valve are marked with a D on the pump housing's end plate, see figure.

New Ref. No.	Description	Excl. Ref. No.	Remark
503 82 69-01	Shaft seal set	-	
503 82 72-01	Seal	-	
503 82 71-01	Holder	-
